koldo wrote on Fri, 10 April 2009 18:27Hello all

If anybody needs them, in bazaar/sysinfo there are these functions:

.....

// Replace find with replace in str

String Replace(String str, String find, String replace)

Best regards

Koldo

OK... I created replace method too:

```
String replace_string(String& s1, String& find, String replace){  
    String string_result;
```

```
    int start_pos = 0;
```

```
    int found_pos = 0;
```

```
    int find_len = find.GetCount();
```

```
    int s1_count = s1.GetCount();
```

```
    while(((found_pos=s1.Find(find, start_pos))!=-1)){
```

```
        string_result.Cat(s1.Mid(start_pos, found_pos - start_pos));
```

```
        string_result.Cat(replace);
```

```
        start_pos = found_pos + find_len;
```

```
    };
```

```
    if(start_pos<s1.GetCount())
```

```
        string_result.Cat(s1.Mid(start_pos));
```

```
    return (string_result);
```

```
}
```

If is possible, may be add the most optimized replace function in String utilities!

It is very usefull method!
