gprentice wrote on Mon, 01 June 2009 05:26 Anyone got a recommendation for a subversion client for Windows. Preferably one that allows a local repository as well as network and web repositories.

I haven't used subversion before. Is there anything special you have to do to get U++ code from google.

If google is not the main repository for U++, how do check-ins get to the main repo? I assume there's no locked checkouts?

Graeme

I use SmartSVN (www.syntevo.com/smartsvn/). It's the best client IMO (I tried many) and works on linux also.
