gprentice wrote on Mon, 01 June 2009 05:26 Anyone got a recommendation for a subversion client for Windows. Preferably one that allows a local repository as well as network and web repositories.

I haven't used subversion before. Is there anything special you have to do to get U++ code from google.

If google is not the main repository for U++, how do check-ins get to the main repo? I assume there's no locked checkouts?

Graeme

I suggest getting just commandline

<http://www.sliksvn.com/en/download>

and then just use svn support in theide. It is highly automated... But you need to issue at least the first checkout from the commandline.

Another popular choice seems to be TortoiseSVN.
