Hello All,

I didn't find if exist a method for set include option for specific package.

I thing that it is a possibility to add "compiler option" in package organizer, but if exists more explicit method which i do not know, please tell me.

I want continue to develop wrapper xlslib package started by Koldo.

This will be great because in include option will be not need to add the full path of include directory, but on compiling process, IDE will add full path. Another opportunity is increasing compilation process: specific include folders by package will set in case the developer will use this packages with specific include option.

In base of xlslib package we will add in package organizer for link option only:
 /lib/common
 /lib/xlslib
 /lib/oledoc
 /lib/data

This realization can be uses in sdl package too, or in other external plugins.

I hope I was clear

Thank you in advance.
