Hello Mirek,

I added the minimal changes for future: include options for specific package, I hope it is correct.  
Can you check my changes?

Dirrectory path is same as files <directory>{\<directory>}  
Ex: lib\common

If is accepted I can add more wizard things(select directory path dialog, set full path or short path).  
Include order, I should add first UPP directory (GetVar("UPP")), after then include directories by  
package uses and after then add global include path.

The source code is written very clear and professional. Thank you to U++ authors and  
contribuitors! Of course, exist things that can be optimized (in my point of view)!

I was attached only changed files.

Any suggestions is welcome!
