Is all this about

`#include <header.h>`

in existing code? (instead of `#include "header.h"` or something like that).

I am not quite sure about it either. In ANY CASE, it should NOT accept absolute paths, or at least, warn about them.

Mirek

I agree with you about warn when set full path in include option by package.

Another question is where need to add include option by package by order?
After `GetVar("UPP")`?
can I add it in svn with all changes requested?
