skyhawk wrote on Sun, 14 June 2009 12:17To import/convert existing projects into Thelde it would be nice to import an entire directory-tree at once.

Now, creating a package for an existing project that contains 10 directories is quite some work.

Also, you must be very careful not to add files to the package that Thelde does not support because (referring to the earlier bug report about png/bmp files) because Thelde will crash and not save the project, so you have to start all over.

Suggested feature:

Import a directory-tree, perhaps specify to import only a certain mask, also add an option to separate the files per-directory.

Something like:

Import: /home/jan/myprogram/head_revision

mask: *.cpp, *.h, *.i, *.ico

[x] create separators for each directory

Greetings,

Jan

Done.
