2. Format? some of the cells (coloumns) in the row are string, other are integer.

Quote:

also, don't forget a useful method ToString() ...

What do you mean? Why I need this method (sorry for this silly question).

b)

```
String s;  
int int_row = arr.GetCursor();  
for (int i=0; i<arr.GetColumnCount(); i++) {  
    s << arr.Get(int_row, i);  
    s << "...";  
}
```

Luigi

If you are going to write your data into *.txt file, everything must be string or char. According to my knowledge... Or do you know other methods?

If yes, then converting to string is useful.

Also you need kind of a record structure (format)? column and rows delimiters?
