Hi all,

As a newbie to this forum I like to thanks all of you to make this open source community as big as this....

I'm doing one of my academic projects, which is assigned by my professor. He gave me a touch input panel/device with some demo application and driver for windows. Now, my task is to make a clone of the same application and driver for linux(UBUNTU).

So, after searching a while I decided to start with Ultimate++. May be its possible for me to develop an simple application with my little bit knowledge of C/C++....but how to make this application work with my embedded touch panel? I don't know...what I know is this thing has been done by a driver? But how and where to start for developing a driver for my application to take touch input from my touch panel?? Can anyone enlight some way for me pleeeeeeease ...

Thanking in advance,
Siddiquee
