And if you don't have to provide full linux driver, just the working application, maybe it will be easier to hack just some nasty code to read values from panel without driver, but I never did direct access to HW under linux, so I can't help with that either.

Anyway, once you will know how to read values from the panel in C++ (either nice driver or some quick hack), the U++ should help a lot then with the application alone.

If you manage to create same/similar driver interface like in windows, you can use U++ to create the same application for both linux and windows then.
