Hello luzr

Sorry, I do not understand

For example in case xlslib:

- We have these files to compile

lib\src\xlslib\blank.cpp,
lib\src\xlslib\cbridge.cpp,
lib\src\xlslib\cell.cpp,
... total 30 files ...

- These files have includes located in here:

lib/src/common,
lib/src/data,
lib/src/oledoc,
lib/src/xlslib;

(you can see that all the paths are under package directory)

- And the compiler has to use these directories before the included in Setup/Build Methods

How would it have to be done with the new "Add to include path" option ?

Best regards
Koldo
