Hi Pavel,

sorry that I didn't answer earlier, I was in vacations.

The BSD flag needed for newer SVN versions was added long time after 2008.1 release. That means if you compile SVN version with the 2008.1 version the first time you have to set BSD flag manually to get a good compilation run, because it is not set TheIDE-internally. Then after when you use the new compiled TheIDE version BSD flag is set automatically on FreeBSD, so everything should work concerning that. That was the problem you had.

I must admit, I didn't check lib dependencies once again after the transition to define platform in config.h for GTK bindings, so I will check that on my BSD platforms to see, what is really needed to fix that.

Matthias
