Hi,

Today I wanted to build a package on a remote linux machine, using Thelde from a command line. From what I found in manual and in this thread, Thelde should compile the specified package without invoking GUI.

But it's not completely accurate. Thelde doesn't show up at all, as expected, but windows about updating codebase and Assist++ still appear on start.

I was trying this over ssh and it works only if X forwarding is permitted. If it's not then following error appears: No protocol specified

No X11 display, errno = 0, Succes

X11 error !

I also tried in console on my local machine and got an "couldn't open display" error.

Appart from this, everything works perfectly. It's just a bit annoying, because I was on a very slow connection and the forwarding of those two dialog boxes took longer than the rest of compilation...
