I replaced the LOG() by DUMP() for easier output:

```
name = xxxx
```

```
height = 0
```

```
q = 0
```

```
AStdFont = <sans-serif:12>
```

and the fact is that my std font in Gtk is 9 pt, not 12... it seems the alignment is wrong only when the font size is set to a value smaller than 12. With the same font (Sans) at 12 or greater, the alignment is correct.

Besides, it depends on the font used... some show an alignment problem, others don't. Is that a kerning issue? (I'm absolutely not versed in font management.)
