
Subject: SysInfo, String functions and cygwin

Hi,

I usually develop my software under linux, and when I want or need a windows version just compile it using cygwin and mingw, the resulting executable is directly usable under windows.

My problem is the following:

The SysInfo package does not compile under CygWin (I could expect that due to the nature of the package).

the String Replace(String str, String find, String replace) function is part of SysInfo and i need (only that)

I know this subject has already been discussed before, but all the pure string functions should be moved to core or somewhere else.

I resolved it by copying the needed function so I could remove the SysInfo package. But that's definitely not very cool !
