Quote:One thing is not clear to me yet:

Was you able to compile upp-*-src.tar.gz without changes? (just using make / make install)?

Mirek

Compiled without changes, yes.

- I used make + custom parameters to compile (see previous post).
- I didn't use 'make install' because the script doesn't copy U++ files where it should. I do this part directly in the rpm '.spec' file.
- I create my own GCC.bm file (as show in previous post, using rpmbuild macro).

This works with upp-x11-src-1438.tar.gz and with previous releases.

But upp-x11-src-1438.tar.gz and other don't have the spec file included so this file is external.

If you want to create automatic rpm build, it will be a pleasure to help out.
