Thanks for the hints Mirek.

I tried without subpixel rendering but the problem is the same.

In fact, I found where the problem comes from :

for some reason I can't remember, but probably to get harmonized font sizes between gtk apps and other ones, I switched my dpi to 88 (I think it is 96 naturally). I used 96 dpi instead of 88 and all the issues are gone, see by yourself :

It reminds me some topics where you were talking about the dpi concept problem, and the way it was badly handled by other libraries.

Is that normal that when specifying a wrong dpi (that is configurable so after all, I believe other people do like me), I get thoses issues ? Are there several ways to get proper font hinting size ?

Thanks for your help,
Lionel
