ptDev wrote on Sun, 28 June 2009 09:50It's true, and I found this annoying too. Especially considering it's just a 44kb dll.

However, if one uses the '-static-libgcc' option, the dependency is removed. This is something to keep in mind.

Perhaps we would have to propose Theide developers to include this in source code.

A possible implementation could be in file GccBuilder.cpp, line 130, adding this:

```
if(HasFlag("WIN32")) {  
    cc << " -static-libgcc";  
}
```

I have compiled Theide with this change and I have debugged programs with MinGW 4.4.0 and without libgcc\_s\_dw2-1.dll without problems.

Best regards

Koldo

I think it should work via build method too, correct? (In that case, I can make it part of mingw autoseup).
