I just have a quick question: is it intended behavior that the navigator bar list does not take dpi into account? To make a try I used a very small dpi (50). Normal text is hardly readable at this dpi on my PC. I launched theIDE and I discovered that the bottom list of the navigator bar uses the same font size (in pixels) than when I use 88 or 96 dpi. That is really not a problem for me, just wanted to check if it is intended behaviour.

Well, after some checking, the reason is that the font is scaled using layout scale (VertLayoutZoom).

Anyway, there is "small font size" protection in layout scaling - basically, layout are not scaled down below designed size. They can only scale up. This is to avoid numerous troubles in the process. Here, this heurestics applies to the font too.

I am not sure whether this is worth fixing.
