I would like to see this project expanded into a general charting library. It has a lot of potential especially when combined with the new headless drawing capabilities.

Google has an online charting service. But if they change it, a lot of programs will break.

One of the more confusing things is setting coordinate transformation/translation. I am currently using Win32 API to set xformations. Like this:

```
XFORM xm_ = { 1, 0, 0, -1, FLOAT(size.cx -100), FLOAT(Offset + size.cy+50)}; HDC hdc = w.GetHandle(); SetGraphicsMode ( hdc, GM_ADVANCED ); SetWorldTransform ( hdc, & xm ); // do something SetWorldTransform ( hdc, & xm_default ) ; // restore coordinates
```

This is only valid for WIN2k or later.

I am unsure how U++ draw does xforms.
