Actually, Color is defined in Core. But I guess, using a little C++ magic, we can make this work without actually requiring any data...

Like

```
struct HtmlColor {  
    enum Value {  
        ... your list here  
    }  
};
```

```
class Color {  
    .....  
    Color(HtmlColor::Value x);  
};
```

What do you think?

Mirek
