2. This method saves SQL trafic and network speed on Huge Database.

If you have huge database, than you usually don't display everything at once. Beside, I guess, it is faster to send one query with 1000 rows, that 1000 queries with 1 row each.

3. View may not be fully compatible with some database engine.

Than you should use databases, that supports views.

notice a slow connection, because each row of the table passed 5 integer numbers.

If I use a view or LeftJoin, then each row of the table must be sent to 100 bytes (5 fields of 20 bytes), that is slower to 10 times.
