Recently I tried to use newly added charset:

which should had displayed Russian characters inside Windows' console app (which uses native CP866 for characters). But my output was a number of "error" symbols.
I don't know if it is a bug or I did something wrong. How could I convert my UTF8 string into CP866?

Also I'd like to ask Mirek to give a simple example how could I add MBCS charset into U++.
