cbpporter wrote on Fri, 16 October 2009 15:14Did you try turning on the hotspots before copy. I doubt that when you copy you copy the hotspot positions also, because the format must be readable by other programs and default formats do not have the concept of image hotspots. When you create the new image and paste the graphic, it will have its hotspots put in the default location (0, 0) and this will change the shape of the image once it is rendered.
To activate the hotspot display, press H in the image editor or use the toolbar.

Thank you very much! You gave me the right hint!

For me it seems like this hotspot-things also isn't copied within the IML editor when using the clipboard. But I moved the hotspot to the correct pixel with my mouse and now it works!
