Mirek,

I need a way to group controls in my dialog into two groups and split the two groups using a Splitter control. It makes sense to use the LabelBox to group, but as I mentioned in my previous post, the LabelBox seems to "eat" the events to their children.

Therefore, I just experimented using the ParentCtrl instead of the LabelBox. Works fine. The problem is the lack of visual aspects for the users. They can't tell the groups easily and they cannot see there's a splitter between the two groups. Can you please help me with a work-around. Thanks
