Hello,

thank you for the response I'm sending you logs I've collected while testing the issue after activating ELOGs. Calling GetSysTime in ELOGs causes crashing application occasionaly - look at the date in a2.log for example. Removing GetSysTime from ELOGs causes to freeze the application only "in the old manner"

Removing SetTimeCallback from Kmedis contructor and closing the application manually makes the same results. All log files are commented at the beginning of the file.

Gabi
