Yes,

A1 and B1 are from running the application without crashing or freezing. All As are from runs with GetSysTime in ELOGs. All Bs are from runs without GetSysTime in ELOGs. Some of them are with and some without SetTimeCallback in Kmedis constructor, which proves, that calling SetTimeCallback in Kmedis constructor has no effect on the bug.

In Bs the application hangs apparently on ExitLoopEvent().Wait() line in GuiSleep0(). I can prove it by putting RLOG before and after the line.

Gabi
