Hi exdatis,

You can write it without the ugly iterators as int index\_test;  
for(index\_test = 0; index\_test < ls\_town->GetCount(); index\_test++){  
 if((\*ls\_town)[index\_test].getName()=="Pancevo") break;  
}

PromptOK(AsString(index\_test));

There are probably even better/faster solutions, but those would depend on how TownLs class looks like...

Best regards,

Honza

EDIT:Oops, I missed that ls\_town is a pointer Corrected now
