Hi exdatis,

```
You can write it without the ugly iterators as int index_test;
for(index_test = 0; index_test < ls_town->GetCount(); index_test++){
    if((*ls_town)[index_test].getName()=="Pancevo") break;
}
```

```
PromptOK(AsString(index_test));
```

There are probably even better/faster solutions, but those would depend on how TownLs class looks like...

Best regards,

Honza

EDIT:Oops, I missed that ls\_town is a pointer Corrected now
