exdatis wrote on Wed, 30 December 2009 04:14Is that right ?

```
int index_test = 0;
for(Vector<TownLs>::iterator q = ls_town->Begin(), e = ls_town->End(); q != e; q++)
{
    TownLs temp = *q;
    if(temp.getName() == "Pancevo")
        break;
    index_test++;
}
PromptOK(AsString(index_test)); // index
```

//desc: ls\_town is pointer (Vector<TownLs>)

Better method, any?

Thanks.

Consider using Index instead of Vector...

Mirek
