- I've also changed it to use ArrayCtrl::StdBar and set the ArrayCtrl cursor correctly to enable this, which is more in line with the way the ArrayCtrl works.

Not really. You had to do that exactly because you have not got called EditField RightDown - that one sets focus and this moves the cursor in ArrayCtrl

Note that the fundamental problem, one we have spent 2 hours of icq exchange with mdelfede yesterday, is that if you just resolve problem by changing EditField menu routine, adding ArrayCtrl Bar if ArrayCtrl is ancestor widget, you run into the issue with ArrayCtrl deleting lines - in that case widget gets deleted by menu.Execute in RightDown and the method continues afterwards.

That is why we need PostCallback.

Mirek
