It works as all your code although this time it is not at all friendly and in the lazy people style

1. If I desire a three state button with no standard images I think should be enough a declaration as this:

```
btnOpt.Add("Label_text", img1thState, img2thState, img3thState);
```

where img1thState, img2thState, img3thState are the images defined in the *.iml file.

2. The minimum dimension of the button should be calculate considering the text lenght and the greatest of the three image dimension.

Luigi

1. and 2. I expected you are not so lazy... and add this functionality yourself...

Btw, 2. - Do you want different size images? - it's even more against native look

1. I've learned the lesson and now I trying to think in the laziest way I can

2. Of course not, I was just speaking in general.

Luigi
