mhhh... parse vars that are all in form '##sometext' is quite easy and efficient with simple Upp code imho....

Max

Yes. Parsing of simple stuff is easy. But when syntax gets more complicated it is almost impossible to develop something working. Do not forget about error reporting and debugging of grammars. It is often very hard just to design a grammar for your language.

boost::spirit produces code, which is very efficient, and you can declare your LL grammar right in the C++ code. That saves time
