Subject: Debian repository up and running

Hello all!

As I promised on the meeting last week, I've started to investigate the possibilities of using launchpad.net to build debian/ubuntu packages. Today, after several unsuccessful attempts, I finally got it right. For anyone interested, here is a link with instruction how to add the repository to your system: https://launchpad.net/~dolik-rce/+archive/upp/. Amd64 and i386 architectures are supported.

For now my approach is partly manual, but in next days I'll automate it in a nice, simple script (hopefully nice&simple ). I'm packaging the nightly X11 build, in the repo is now revision 1875. It should behave exactly the same way as the amd64 debs produced in nightly builds and Koldos i386 packages published on sourceforge (the script is almost identical). If you try it, please let me know about any unexpected behavior.

The next step should be to integrate this script into upp server infrastructure so it all works automatically (if Mirek agrees). The only question is if the repository should contain stable releases or nightly builds. What's your opinion? Or should we have upp and upp-nightly repositories?

Best regards,
Honza

EDIT: Fixed typos
