Since then I used Clearcase/CVS/SVN and now HG.

In my case it is CVS/Clearcase/SVN/Perforce and now I'm using monotone at home.

Quote:

Once you have tasted DVCS and really learned to use it at its full power, you cannot come back no matter which DVCS you are using !!!

Imagine a project, which employs several hundreds developers, and VCS has several hundred thousands revisions. You will not be able to clone a repository in this case.

Actually, I figured out how to switch to a different branch in monotone.

1) Check out a branch1:

```
mtn --db=database --branch=branch1 co .
```

2) Update to a branch branch2:

```
mtn --revision=h:branch2 update
```

So, now I know how to work with different branches using only one directory with three different DVCS: GIT, Mercurial, and Monotone.
