cbpporter wrote on Wed, 27 January 2010 10:33... an assembly, but is very similar to the classpath from Java.

 you basically "had Web.jar missing from your classpath.

I appreciate your explaining this. In Java using Eclipse the classpath is set in the IDE in a different way.

I got it so clicking Points->Get Point 1 (and Point 2) returns the correct location from the Nww app and displays in the Point 1 and Point 2 text boxes.

I have several other .java files I will be porting to C++ .h files, parse, format fixed setPrecision, deg min sec, GotTo, GPS tracking, calculate distance and direction, etc.

I appreciate getting this header file problem worked out and info on how the "classpath" is handled in TheIDE.

Thank you cbpporter!!!
