1) Check out a branch1:

mtn --db=database --branch=branch1 co .

2) Update to a branch branch2:

mtn --revision=h:branch2 update

That's something I personally dislike at monotone, it's showing you his internals. Using it you know you're using a VCS which use a database.

You need to specify a database only once when you create a workspace. This nice feature lets you create multiple workspaces using only one repository/database.

I personally find monotone much easier to use comparing to GIT and Mercurial. Though I miss good implementation of sub-modules.
