I only use NOGTK because on the systems where I install the headers are not available or needed (KDE machine). If you have Gnome installed it is pleasant to have U++ look the same as the rest of your applications.

Dependencies for NOGTK Debian 5:

build-essential

libx11-dev

libxft-dev

libpng12-dev

Dependencies for GTK:

libgtk2.0-dev

libnotify-dev

Still I couldn't link. I got a bunch of error like "undefined reference to 'png_write_row'".

EDIT: Using a normal (GTK) build I no longer have link errors. Problem is NOGTK.

I think we should provide two packages for the two modes of operation. And I also think I should create a new skin using traditional Chameleon theming to replace normal NOGTK theme. Current is similar to XP but uglier. I think that we should a theme that looks like something from 2010 and not 2000.
