mr_ped, could you try a NO_GTK build?

I would like to update the build scripts.

When installing a deb everything seems OK. When building manually from sources, one would expect:

1. Everything to work
 2. Behavior of installation should be comparable with other packages. I'm not saying that we should use autotools, because they are bloated beyond comprehension, but some base functionality like giving an error that lib is missing and supporting the standard --prefix and installation in /usr is a must.
