So to summarize:
1. Problems are visible with KDE and I remember and old post regarding XFCE (probably any WM that is not Gnome) with Gtk build. The skin seems to be the same in all cases, but different from when running under Gnome, but I'll experiment to see if problem is general.
2. All Gtk build have problems with editfields when they are too small. I wonder if we are sure that information from Gtk is correct then we can clip the editfield contents?
3. I'll try to produce a "domakenogtk" script.
