2. All Gtk build have problems with editfields when they are too small. I wonder if we are sure that information from Gtk is correct then we can clip the editfield contents?

The problem there is that Gtk approach to drawing editfields is completely different.

For GTK, editfield is undivisible entity similar to Button. So it draws background and text over it.

In U++, EditField is only the text area and is combined with Frame to provide the complete appearance. Plus, there can be more buttons etc...

So afwful amount of heurestics is required to extract something reasonable from this mess.
