In linux_scripts there is a script to build .deb that works very well for me.

It has been done by dolik.rce based in the work of mdelfede.

It is used in the U++ announcements to get the i386 .deb.

Actual script used for nightly builds is in uppbox/Scripts. It is still the same script.

Hi Mirek!

Sorry for off-topic, I just want to clarify the situation about scripts. The original script used for producing debs (which clone is still used for nightly builds) didn't work for Koldo for some reason. I couldn't really find why, since on my machine it was working fine. But in the process I've noticed few places in the code that could have been written better or simpler. Therefore I rewrote the stuff and it is now in linux_scripts and Koldo uses it for 32bit builds he puts on sf.net. (By the way, I recently found there is quite a lot of mistakes in all of those scripts and I'm working on their corrections.)

Honza
Hello Mirek

If linux_scripts is deprecated it is better to remove it.

Until today linux_scripts was the place to put these scripts so updates have been uploaded to that folder and .deb have been generated using it.
