This problem might not be a high priority - in the reference splitter example, buttons B,C,Toggle are arranged vertically. If you drag the top of button "Toggle" up until button C disappears, you can't drag it back down again. You can drag upwards at that point though, and button C reappears, consuming some of button B space. If you drag upwards to make the "Toggle" button take all the right hand vertical space so that B and C disappear, you can't drag down again and buttons B and C have disappeared forever.
