If I do a lot of sections / frames so that the scrollbar appears, I try to navigate through the fields using Tab / Shift + Tab. When I move below the scrolling region, the frame does not scroll automatically, and further movement between the fields I can not see.
To see at what I field, and generally to see this field I have to help with the mouse, what is wrong.
I believe that this package is interesting primarily for editing large forms, which can not be placed entirely on the screen.

How to automatically move the scrollbar, using the Tab / Shift + Tab, the current field would be visible all the time?
