Well, I discovered that in no way this 'gamma' letter can be passed to windows... Maybe it doesn't exist on its charsets.

Replacing it with another 'simil-gamma' found on windows did the trick.

Btw, the other 'big' problem in my app was GetSystemLNG(), which returns not only the language but also the active charmap :

```
lang = GetSystemLNG();  
String langStr = LNGAsText(lang);
```

lang is 18141492 and langStr is "IT-IT windows-1252" in my machine.
Not sure about but, doing

```
SetLanguage(lang);
```

seems to activate both italian language AND 1252 codepage, making all UTF8 chars in app to disappear and/or be scrambled.

The solution was :

```
lang = GetSystemLNG();  
String langStr = LNGAsText(lang).Left(5);  
lang = LNGFromText(langStr);  
SetLanguage(lang);
```

stripping so the codepage from language string and reconvertig to integer, which in my machine gives lang=315700 and langStr="IT-IT" and allows UTF8 chars to behave as usual.

Note that this problem arose just on windows; on Linux it was all ok.

Ciao

Max
