Subject: Re: Sharing and Locking Posted by gridem on Sun, 21 Mar 2010 10:39:22 GMT View Forum Message <> Reply to Message

luzr wrote on Sun, 21 March 2010 09:37 You miss the point: When the file is closed?

(I know when, of course, but the point is the shared ownership makes this very uncertain). OK, usage sample:

```
void SetterThread()
{
  for (int i = 0; i < cycles; ++ i)
  {
     // create file object
     FileObject file;
     // assign reference to global variable
     *DataAccess::Access() = file;
     // create file itself
     file.Open("file.txt");
     // write some text, file will be opened because accesser doesn't use close
     // (try ... catch is not needed)
     file.Write(String().Cat() << "[" << i << "] setter");
     // close the file, accesser now cannot write into file
     file.Close();
  }
}
void AccesserThread()
{
  for (int i = 0; i < cycles; ++ i)
  {
     try
     {
        // try to get the real object from global reference
        FileObject file = DataAccess::Access()->Get();
        for (int j = 0; j < internalCycles; ++ j)
        {
           // try to write into file
           file.Write(String().Cat() << "[" << i << "," << j << "] accesser");
        }
     }
     catch(Exc& e)
     {
        Out(String().Cat() << "[" << i << "] Accesser error: " << e);
     }
  }
}
```

In the considered implementation the File lifetime is always predictable while lifetime of FileObject can be longer.

See attached file for detailed information.

Regards, Grigory.
