Here is the Linux version.
edit: The link was removed, still have a glitch when downloaded.

I have not tried all the functions yet, what I have tried worked.
I will change the dir for the file chooser later, that is only used to interact with another app.

This can be used by itself.

Now the hard part, making a Help file to explain how it can be used. Since it is menu driven most functions are self explanatory.
One thing to remember is after typing or pasting in the latlon for a point (or distance,angle) press Enter, I forget sometimes.
The latlon should be comma separated.

Neil
