Hi,

The summary from Matthias is very accurate. I would like to just add that the initial idea was to get theide-like possibilities even on systems where theide is not installed, mainly to make export and distribution of apps easier.

Reini, no one is going to stop you if you try implement this with premake or any other build system. Actually opposite is true - the more possibilities we offer, the more users should be happy because they find something they are familiar with.

BTW: There was attempt to use cmake to build u++ (by Sender Ghost), but AFAIK it was not succesful (yet) because of some problems with icpp files handling. Similar problems might arise with premake.

Best regards,
Honza
