Well, at least you can know which is the application you have to communicate with

Eheheh.. right.
I found 2 solutions, one for windows and one for linux, but they've quite different approaches and
requires some low-level CtrlCore stuffs.

IMHO the end solution would be to have a call to PostCallback() with the command line of second
instance fired on first instance.
That would allow any handling without disturbing the app in the middle of some operations.

Ciao

Max
