forlano wrote on Sat, 13 March 2010 14:07Hello,

I am trying to replicate an application written in PHP+MySql with Upp+Sqlite. I have two questions.

1) With the following table I have problem at runtime

```
TABLE_(DBELO)
  STRING_ (NOME, 35)
  INT_ (ELO)
  STRING_ (CAT, 4)
  INT_ (K)
  STRING_ (SIGLAPROV, 2)
  DATE_ (DATA)
  INT_ (IDFIDE)
  INT_ (IDFSI) PRIMARY_KEY
  STRING_ (SEX, 1)
END_TABLE
```

ERROR Cannot add a PRIMARY KEY column(0): Preparing: alter table DBELO add IDFSI integer primary key

The problem disappears if I move the field
INT_ (IDFSI) PRIMARY_KEY
at the top of declaration. Is it normal?

I am afraid yes. Why do not you want it to be first?

2) I have used the Firefox plugin SQLite Manager to import the data (csv file) from MySql into Sqlite database. Now I am going to write the Upp code to perform some operation. The question is: Do I need a schema file in order to work with a sqlite database?

No, you do not.

Can I update, select, delete data without a *.sch file?
I know that it can simplify the tasks but I do not care.

Yes. You might need to define some SqlIds if you want to use SqlExp. And you cannot use S_* structures to fetch whole records.

But other than that, of course, you do not need .sch. .sch is just extension/option.
